

Gone Fishing

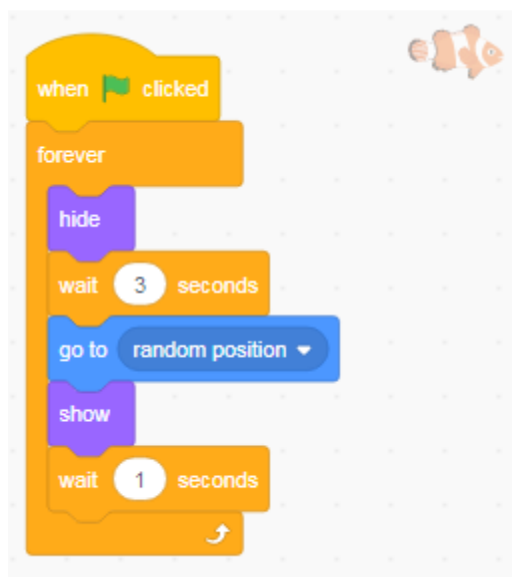

In this game, you can catch fish and keep score!

See the completed project at <https://scratch.mit.edu/projects/90784475/>. Based on the original <https://projects.raspberrypi.org/en/projects/ghostbusters> (but fish).

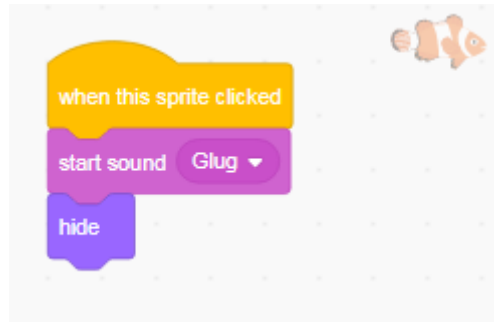

Step 1: Catch a fish

- Choose an underwater backdrop, and a fish sprite.
- Add this code to your fish, to make it appear and disappear.

- Test it out!

- Once it is working, add the code below to catch the fish.

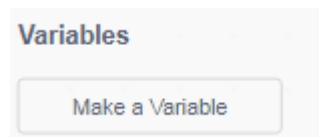

- When you click on your fish, it should play a sound, and disappear!

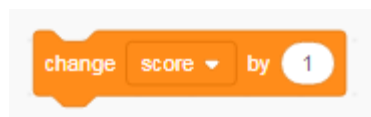

Save your project

Step 2: Add a score

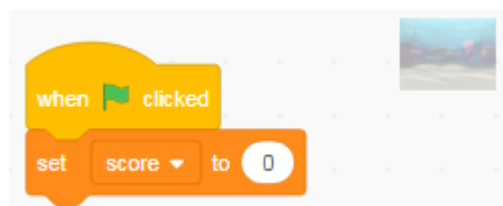

- To keep track of how many fish we catch, we need a score!
- In Scratch, we do this with a variable; this is how the computer remembers things.
- Click on 'Make a Variable' in the Variables section of blocks:

- Give your variable a name ('score' is a good idea!). You will see new blocks appear.

- Add this block at the end of the 'When this sprite clicked' code, and test it out!
- You will also need to set the score to zero at the beginning of the game. It is a good idea to put this code on the backdrop:

Step 3: More fish (and a diver!)

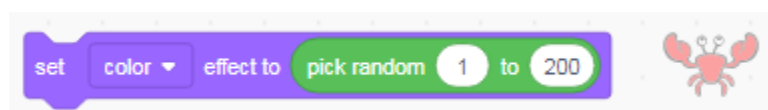

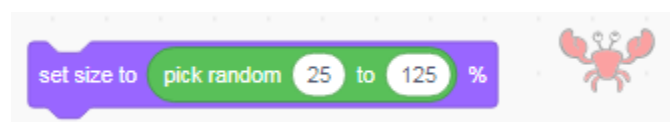

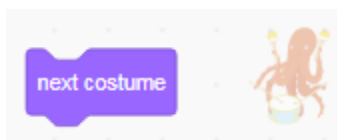

- Now you have one fish, you can add more sea creatures, and give them similar code. I added:

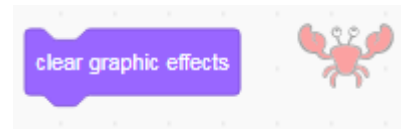

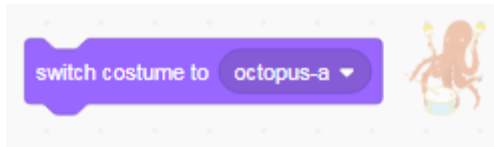

- I copied the fish code and changed it a bit each time. The code for the diver is:

- Notice the 'pick random' block, this makes the diver appear at different times.
- Also notice that clicking the diver changes the score by minus 1, you shouldn't be catching the diver!
- For the octopus and the crab I used some of the blocks below, and changed the 'pick random' numbers so they appeared at different times:

- You may also need these blocks when the green flag is clicked:

Save your project

Step 4: A timer

- Let's make the game a bit tense by adding a timer that counts down to zero!
- This code goes on the backdrop too (add it on to the green flag block):

- My timer is set to 30 seconds, but you can choose how long you want your game to last.
- Ask a friend to play your game – does everything work correctly?
